Ryan Hartman
Plant & Project Engineer
MasterNet Ltd
Mississauga, ON

Manufacturing high quality extruded netting products demands strict attention to detail and a constant awareness of processing parameters.

"One area of our operation that had always been an issue for us was getting consistency in color during production runs." Said Ryan Hartman, Plant and Process Engineer at MasterNet. "We have existing blenders and feeders on most of our machinery but none seemed to give us consistent color product. So we would keep adding color until it was acceptable." Hartman explains the action they took to address this "We looked at the current technologies and made the decision that Movacolor was the best choice for us. We installed our first Movacolor Gravimetric Dosing System on one of our main lines and immediately we were hooked. We experienced instant results in the quality of our product and the color was consistent throughout the entire run." Hartman added "They're easy to use and the controls integrated seamlessly with the controls on our production equipment which really shortened the learning curve." When asked about the accuracy and repeatability of the Movacolor he said "These units are incredibly accurate in dosing color and additives so now we use less of it. A lot less. And that equates to improved quality and reduced scrap.

When the Hartman family founded MasterNet in 1988 they had one goal in mind...To design, engineer and manufacture the best quality netting products on the market. Their reputation for quality rapidly earned them recognition as world leaders in their field.

For MasterNet the decision to purchase Movacolor has proven to be cost effective in saving on color and additives in their extrusion process.
